Faculty of Computing &
Artificial Intelligence
Cairo University

Department: Information Systems
Course Code: IS231
Course Name: Web Technology
Academic Year: (2026-2027)
Semester: First Semester

Project Phase 1

Common requirements for every project

- Teams: 5–6 students. Each team selects exactly one project.
- Phase 1 deliverable: user-friendly HTML pages and styling in external CSS files. No frameworks. The quality and consistency of the design are graded.
- This phase is a front-end deliverable: forms, filters, buttons, and state changes must be represented in the UI, but database storage and real authentication/CRUD behavior are not required unless separately announced.
- Use semantic HTML and appropriate controls (text, email, password, select, number, textarea, checkbox, etc.). Do not hard-code a value in a form field where the user is expected to enter it; sample values on demonstration cards/lists are acceptable.
- Provide at least eight distinct HTML page templates. The eight-page baseline is listed for each project below; teams may add pages if needed, but extra pages are not required for parity.
- Show navigation appropriate to guest, regular-user, and administrator/company-admin states, and keep navigation consistently available across pages. For Phase 1, role-specific navigation may be shown through static page variants.
- For the prototype, a role selector can illustrate the two roles.
- Include all source files and a cover page with student names, IDs, group number, project name, and project number. Submit one compressed folder as LeaderID_ProjectNumber_TAName_PhaseNumber.zip/.rar through the team leader.
- All team members may be asked to explain the submitted work. Cheating receives zero; no late submission is accepted.
- Deadline**:** **Wednesday 04/11/2026 10:00 PM** (Link will be provided on classroom). Further Discussion instructions will also be announced on classroom.

PROJECT 1 | RECIPE FINDER

A recipe catalogue where users discover recipes and save favorites, while administrators maintain the recipe collection.

ADMIN / OWNER WORKFLOW	USER WORKFLOW
Sign up and log in; view the administrator recipe list; add a recipe; edit or delete an existing recipe.	Sign up and log in; search and browse recipes; open a recipe detail page; add/remove favorites; view the favorites list.

Required data and behavior

- Main record fields: Recipe ID (system-generated), recipe name, course (Appetizer / Main Course / Dessert), ingredients (one or more ingredient-name and quantity pairs), and description/instructions.
- Search criteria: Recipe name, ingredient, and course.
- Personal user action: Add or remove a recipe from Favorites; the Favorites page shows the user's saved recipes.

Required 8-page baseline

1	Home / landing page
2	Sign-up page
3	Login page
4	Recipe browse and search page
5	Recipe details page
6	My Favorites page
7	Admin recipe list/dashboard
8	Add/Edit Recipe form

UI acceptance checks

- Forms use visible labels and suitable input types; include required-field cues and sensible sample states.
- Search/list pages show filters, status where relevant, and a no-results or empty-state message.
- Buttons and links are labelled clearly; users can navigate between the relevant static page templates.
- The personal action has a visible result state (favorite, borrowed/returned, completed, or applied).

Scope clarification

Represent multiple ingredients as repeated name-and-quantity rows in the form. Recipe instructions should be readable on the details page.

Shared rule: include guest, user, and admin navigation states where relevant; use consistent layout and external CSS across all pages.

PROJECT 2 | ONLINE LIBRARY

A book catalogue where users search for books and manage their borrowed-book list, while administrators maintain the catalogue.

ADMIN / OWNER WORKFLOW	USER WORKFLOW
Sign up and log in; view the administrator book list; add a book; edit or delete an existing book.	Sign up and log in; search and browse books; open book details; borrow an available book; return a borrowed book; view current borrowed books.

Required data and behavior

- Main record fields: Book ID (system-generated), title, author, category, description, and availability (Available / Borrowed). Treat each catalogue record as one borrowable copy for this project.
- Search criteria: Book title, author, and category.
- Personal user action: Borrow an available book or return a borrowed book; the catalogue availability and My Borrowed Books list reflect the displayed state.

Required 8-page baseline

1	Home / landing page
2	Sign-up page
3	Login page
4	Book catalogue and search page
5	Book details page
6	My Borrowed Books page
7	Admin book list/dashboard
8	Add/Edit Book form

UI acceptance checks

- Forms use visible labels and suitable input types; include required-field cues and sensible sample states.
- Search/list pages show filters, status where relevant, and a no-results or empty-state message.
- Buttons and links are labelled clearly; users can navigate between the relevant static page templates.
- The personal action has a visible result state (favorite, borrowed/returned, completed, or applied).

Scope clarification

The Borrow action is available only for books marked Available. On the static Phase 1 prototype, show the unavailable state and return control as UI examples; persistent state is not required.

Shared rule: include guest, user, and admin navigation states where relevant; use consistent layout and external CSS across all pages.

PROJECT 3 | SCHOOL TASK ASSIGNMENT

A task-management interface where administrators assign work to teachers and teachers track and complete their assigned tasks.

ADMIN / OWNER WORKFLOW	USER WORKFLOW
Sign up and log in; create tasks; view tasks created by the logged-in administrator; edit or delete those tasks.	Sign up and log in; view only tasks assigned to the logged-in teacher; search/filter assigned tasks; open details; mark a task complete; view completed tasks.

Required data and behavior

- Main record fields: Task ID (system-generated), title, assigned teacher, priority (Low / Medium / High), description, status (Open / Completed), and the administrator who created it.
- Search criteria: Task title and priority. The task list should also make status visible.
- Personal user action: Mark an assigned task as Completed; the completed-task list shows the task and its status.

Required 8-page baseline

1	Home / landing page
2	Sign-up page
3	Login page
4	Teacher: assigned tasks and search
5	Task details page
6	Teacher: completed tasks page
7	Admin: managed task list/dashboard
8	Add/Edit Task form

UI acceptance checks

- Forms use visible labels and suitable input types; include required-field cues and sensible sample states.
- Search/list pages show filters, status where relevant, and a no-results or empty-state message.
- Buttons and links are labelled clearly; users can navigate between the relevant static page templates.
- The personal action has a visible result state (favorite, borrowed/returned, completed, or applied).

Scope clarification

The teacher must see only tasks assigned to that teacher. The administrator's list must show only tasks created by that logged-in administrator. Use sample users/tasks to demonstrate these UI states.

Shared rule: include guest, user, and admin navigation states where relevant; use consistent layout and external CSS across all pages.

PROJECT 4 | JOB SEARCH

A job-opportunity catalogue where company administrators manage their company's postings and users search for jobs and track applications.

ADMIN / OWNER WORKFLOW	USER WORKFLOW
Sign up and log in as a company administrator; create job postings; view postings owned by that administrator's company; edit or delete them.	Sign up and log in; search and browse open jobs; open job details; apply for an open job; view the list of applied jobs.

Required data and behavior

- Main record fields: Job ID (system-generated), title, salary, company, status (Open / Closed), description, and required years of experience. The company is associated with the signed-in company administrator.
- Search criteria: Job title and years of experience. The list must clearly show Open / Closed status.
- Personal user action: Apply for an Open job; closed jobs must not show an enabled Apply action. My Applications lists jobs the user has applied for.

Required 8-page baseline

1	Home / landing page
2	Sign-up page
3	Login page
4	Open jobs browse and search page
5	Job details page
6	My Applications page
7	Company Admin: my jobs dashboard
8	Add/Edit Job form

UI acceptance checks

- Forms use visible labels and suitable input types; include required-field cues and sensible sample states.
- Search/list pages show filters, status where relevant, and a no-results or empty-state message.
- Buttons and links are labelled clearly; users can navigate between the relevant static page templates.
- The personal action has a visible result state (favorite, borrowed/returned, completed, or applied).

Scope clarification

Use company name as a company-admin sign-up field in the Phase 1 prototype. Public job browsing should prioritize open jobs, while the status of closed postings should still be clear in the admin dashboard.

Shared rule: include guest, user, and admin navigation states where relevant; use consistent layout and external CSS across all pages.
